

## CASE STUDY

*Financial Hub*

## Real-time stock market updates and presentation with our Financial Hub function

FinancialHub is a central hub of real-time and historical market data for display on websites and applications. It provides a range of financial information such as funds, securities, analysis, exchange rates, financial status, etc. This product is part of our partnership with Bonnier, one of the leading media companies in Sweden.

### THE CHALLENGE

Bonnier AB has a number of prominent online newspapers; two of which are Dagens Nyheter and Dagens Industri. They wanted a service to display market data on these sites' apps and websites. This service should provide accurate and meaningful information to Bonnier's audience, and be adaptable to varying demands of data from their customers.

### THE TOOLS

.NET

TeamCity

Octopus

Restful services

ODATA query

BurstCache

### THE SOLUTION

Niteco took over from Bonnier's original team to develop and maintain FinancialHub – which collects, processes, and displays financial data.

Highlights of the project include:

- Real-time, delayed and end-of-day data supplied on promise
- Customized for viewers of different investor types: bankers, brokers, asset managers, trading companies, media, individuals, etc.
- Is based on Restful architecture, which enables it to support multiple platforms: web, mobile, tablet, wearables, printable, feeds, etc.
- Interactive look and feel with customizable and responsive charts

Our team's refined working processes enabled us to provide our client with 24/7 availability and rapid response, while FinancialHub went on to serve millions of page views per day on both Bonnier's platforms and their customers' platforms.
